

Project Design Phase

Proposed Solution

Date	30 September 2026
Team ID	Msu207Team5 6ab24d09e6af97f73bc88d13
Project Name	Import Data Using Transform Maps in Sheets
Maximum Marks	2 Marks

1. Problem Statement (Problem to be solved)

Manual data entry from Google Sheets or CSV files into the target system takes more time and may lead to incorrect, missing, or duplicate records. Different field names, data formats, and invalid values can also create problems during data import. Users need a simple and accurate method to transfer large amounts of data without entering every record manually.

2. Idea / Solution Description

The proposed solution uses **Import Sets and Transform Maps** to import data from Google Sheets or CSV files into the target system. The source fields are mapped to the correct target fields using Transform Maps. Data transformation and validation rules can be applied before importing the records. This reduces manual work and helps users complete the import process faster and more accurately.

3. Novelty / Uniqueness

The solution provides a structured way to automate the data import process using field mapping and transformation rules. It can handle different data formats, validate records, identify errors, and manage duplicate records. Users can also review the import status and correct failed records instead of checking every record manually.

4. Social Impact / Customer Satisfaction

The solution reduces repetitive manual data-entry work and saves users' time. It helps improve data accuracy and reduces errors during large-scale data transfer. Users can easily understand the import process, identify errors, and verify the imported records. This improves user satisfaction and makes data management easier.

5. Business Model (Revenue Model)

The solution can be used as a data-import and automation feature for organizations that regularly transfer data from Sheets or CSV files. It can reduce the time and effort required for manual data entry and data correction. Organizations can benefit through reduced operational effort, improved productivity, and better data management. The solution can also be included as part of a software or automation service.

6. Scalability of the Solution

The solution can be extended to handle larger datasets and multiple data sources. Additional Transform Maps and transformation rules can be created for different types of data and target tables. More validation, duplicate-checking, and error-handling features can also be added as requirements increase. Since the solution uses a cloud-based platform, it can support growing data-import requirements with suitable configuration.
